Overview	
	3

Cherryiew: Study Objectives 4. Several entropy and peak demand savings impacts for a census of the largest projects supported by the Energize CT initiative. 9. Provide stakeholders with findings that are relevant and useful to potentially reducing future evaluation costs: 9. Qualitative feedback regarding the quality of savings estimates for large C&I projects. 9. Unalitative feedback regarding the quality of savings estimates for large C&I projects. 9. Investigate trends in key variables that impact evaluation sample size, such as coefficients of variation, and provide guidance on trends for use in future evaluation sample design. 9. Make data from this study available for potential incorporation into future work, and initiate a process for other evaluations to do the same moving forward.

	Included all measures with claimed savings in each project
•	Dropped projects that were not located at one physical address and/or served by the same utility meter
•	Dissimilar savings types (kWh, kW, gas ccf) were aggregated using avoided cost

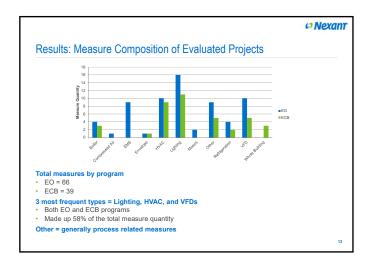

Nexant Methodology

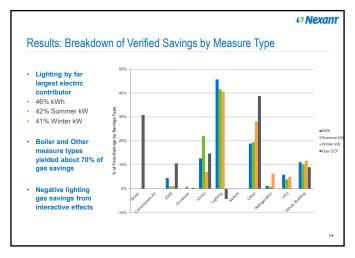

() Nexant Methodology: Project Selection Target = census of 30 largest projects in Energize CT initiative Ranked projects from all C&I programs by total avoided cost from reported savings Requested billing data and project files for largest 60 projects • 15 UI and 45 Eversource Developed Site Specific M&V Plans for largest 35 projects 22 from EO and 13 from ECB · Evaluated 34 of 35 projects

Methodology: Data Collection and Analysis	Methodology: Ev	aluation	Rigor				
M&V used both high rigor and low rigor evaluation approaches		Reported Savi	nas Evaluate	d by Evaluati	on Rigor		
 Low rigor = leverage PSD algorithms and on-site verification 			kWh	Summer kW	Winter kW	Gas CCF	
 Examples: nameplate information, operational conditions, setpoints, schedules 		Low Rigor	13,029,280	1,856	1,496	162,426	
	ECB	High Rigor	8,643,899	1,493	1,280	75,360	
High rigor = followed the IPMVP		% High Rigor	40%	45%	46%	32%	
Examples: power metering, billing data analysis, light logging, calibrated energy models		Low Rigor	4,434,211	211	108	549,110	
IPMVP Options A and B – lighting, VFDs, refrigeration	EO	High Rigor	15,561,518	2,039	1,691	637,723	
 IPMVP Options C and D – whole building measure such as EMS, some HVAC, and 		% High Rigor Low Rigor	78%	91% 2.067	94%	54% 711.536	
envelope improvements	Total	High Rigor	24,205,417	3.532	2.970	713.083	
		% High Rigor	58%	63%	65%	50%	
 Measure-level analysis approach varied based on measure type and contribution to project's overall savings Measure(s) with largest avoided cost in each project received high rigor evaluation 		Percent of Total Program Reported Savings Evaluated					
			16%			Gas CCF	
	ECB	Low Rigor		14%	18%	6%	
	200	High Rigor	12%	12%	15%	3%	
		Total	26%	26%	33%	9%	
		Low Rigor	2%	1%	1%	11%	
	EO	High Rigor	8%	9%	9%	12%	
9		Total	10%	10%	9%	23%	11

ONEXANT

Results: Realization Rate Comparison

- Comparison of Largest Savers results to most recent EO and ECB impact evaluations
- EO and ECB used different end use definitions
- Largest Savers results were rolled up using each evaluation's definitions to allow for comparison
- Caveats on making direct comparisons
- Evaluation rigor
- Sample sizes

Results: Realization Rate Comparison - ECB

			Most Re	cent ECB Eva	luation		La	rgest Savi	ers - ECB Pro)	ects Only			Largest	Savers - Over		
	Measure Type	Measure Quantity	kWh	Summer KW	Winter kW	Gas CCF	Measure Quantity	kWh	Summer KW	Winter kW	Gas CCF	Measure Quantity	kWh	Summer KW	Winter kW	Gas CCF

	Process	21	102%	105%	111%											
	HPBD/Other	10	96%	98%	45%		15	69%	68%	64%		46	73%	79%	85%	
Gas	Boiler	17				96%	3				88%	7				92%
Gas	Other	26				68%	6				94%	19				74%

HVAC – generally <100% realization rates

Operational set points, chiller plant configuration, building occupancy, assumed building max load

Lighting – approximately 100-120%

• Gas

Boiler – assumed level of boiler usage during non-winter months

Other – parameter assumed to dictate equipment use, lower operating hours, controls not used

Winter kW - high c.v. value in Largest Savers due primarily to two projects with high savings

Nexant Nexant Observations and Recommendations Technical Analyses Observation - Equipment operation · Schedule, loading, governing setpoints One of the most common sources of variance between reported and verified savings estimates · Use of different data sources Verified savings had access to metered data while reported savings usually didn't – especially for ECB projects Recommendation – Equipment operation · When feasible and applicable, consider: Pre-retrofit metering (EO) Commissioning activities (ECB) Observation – Interactive effects · Inconsistently taken into account · Gas heating penalty for lighting projects infrequently calculated Recommendation – Interactive effects As a general practice and whenever applicable, account for interactive effects 23 24

25

Observations and Recommendations

Program/portfolio Methods

- Observation Peak demand period Peak demand period changes year to year
- Recommendation Peak demand period
- Consider changing peak demand hours definition from Seasonal Peak Hours to On-Peak Hours
- Simplifies calculating and tracking peak demand savings Costs include: updating tracking systems and processes
- · Benefits include:
- · Custom measures: better alignment of demand savings estimates
- Simpler tracking of estimates over multi-year programs
- PSD updates more streamlined
 Broader cost and policy implications which would warrant a deeper discussion
- Observation C.v. values
- · Key outputs of this study and the previous EO and ECB evaluations were updated c.v. values
- Reco ndation – C v values
- Future evaluation sampling should rely on c.v. findings in this study and the previous EO and ECB evaluations
