

# **R1603 HES/HES-IE Impact Evaluation**

Presented by the West Hill Energy Team March, 2018

# **Evaluation Objectives**

- Develop robust and defensible estimates of the natural gas and electric energy and electric peak demand savings (no water savings)
  - By household and by measure group
  - Seasonal kW peak savings may be difficult to estimate as savings will be based on monthly bills
- Inform and update the PSD
- Discuss possible reasons for realization rates (RR's) substantially different from 1.0
  - Billing analysis comparisons
  - Additional research to investigate measures with major deviations

.

# **Evaluation Period**

#### • Program Years: 2015 & 2016

- Allows for pre/post analysis
- May be able to estimate savings by program year, if there are enough homes in the models

#### Previous evaluation covered PY 2011

Impact report completed in December, 2014

# Initial Data Review

- Review program tracking data to understand program activity
  - Range of measures and savings
  - Household savings
  - o Contractor activity
- Examine 2 previous HES/HES-IE and other impact evaluation reports
  - Assess evaluation efforts and previous findings
- Review PSD savings in comparison to other jurisdictions and impact evaluation reports

### Data Cleaning - Program Data

#### • Program Data – initial analyses

- Number of customers & savings by measure/measure group/end use
- o Completed projects, measures & savings by contractor
- Average heating savings v. estimated average annual heating load
- o Scope of projects average costs, R-values, efficiencies, etc.

#### Key issues

- Matching customers & measures, contractors & customers, auditors & customers
- o Measure-level detail
- o Other home characteristics

#### **Evaluation Components** Component Description Risk to the overall evaluated savings from each Risk Analysis by measure or measure group; Measure Group Incorporates level of uncertainty and size of savings Fixed effects whole house model and house-by-Electric & Gas Billing house models for gas; Analyses Pre/post for retrofit & post-only for lost opportunity measures Conduct additional evaluation activities to improve **Targeted Measure** savings estimates for one or two measure group(s) Research with the highest uncertainty

### **Risk Analysis**

# • Purpose: identify measures with highest risk to program savings due to . . .

- o Unsubstantiated assumptions
- o Reliance on old or discredited research
- Assumption that need updating due to climate change or other factors
- Evaluation uncertainty, including climate zone differentiation

Risk analysis results provide evaluators and stakeholders a guide for focusing evaluation efforts

### **Risk Analysis Process**

- Define measure group categories
- Review previous evaluations and the current billing analysis (if completed)
  - Determine level of risk by measure group based on the range of realization rates
- Develop the risk model to reflect . . .
  - Range of uncertainty in the evaluated savings
  - Contribution of each measure group to the overall uncertainty

# Data Cleaning – Billing Records

#### o Billing analysis requirements

- o Retrofit measures: At least one winter before and after installation
- o Replace on Failure measures: at least one winter post installation
- o Consumption within range of residential use
- o Natural gas consumption shows heating use
- Consistent occupancy
- Homes with wide, unexplained variations in consumption will be removed

# **Billing Analysis Steps**

- 1. Run household regressions to identify homes with weather-dependent loads
  - Use this information to construct variables for the pooled CSTS models
- 2. Develop candidate models for pooled analysis
  - Reflects various configurations of measures and other available information
  - Start with simplest, move to more complex if supported by model

# **Billing Analysis Steps**

#### 3. Conduct model selection

- Use modified information-theoretic approach
- Account for model fit and improvement in estimating items of interest

#### 4. Perform Diagnostics

o Check for influential data points, violation of assumptions

#### 5. Assess impacts of trend lines

 Control for external factors that may account for widespread changes in energy use

# **Billing Analysis Outcomes**

#### o Robust and reliable estimates for ...

- whole house energy savings and
- measure groups with savings in the 10%+ range of preinstall use
- Reasonable savings estimates for . . .
  - measures with savings in the 5% to 10% of pre-install use with AMI data
- Bundled savings for measures that are installed as a group
  - When the savings are large enough to estimate

# Selection of Targeted Measure

- The risk and billing analyses will help us to identify measures with . . .
  - High level of uncertainty in evaluated savings
  - o Inexplicably under- or overperforming

AND

- o Contribute significantly to program savings
- One or two measures will be selected for further investigation

### Targeted Measure Research

- The evaluation strategy will be determined based on the targeted measure.
- One evaluation strategy will be selected, such as one of the following:
  - On site metering or direct measurement
  - Delivered fuels billing analysis
  - Alternative measurement strategies
  - Further research into multifamily buildings

### Issues & Resolutions

#### • Meeting ISO-NE FCM Standards

- Monthly billing analysis does not provide granularity to estimate peak savings
- Approach: leverage other regional studies for larger measures (where available) and drop smaller measures from FCM claim

#### • Double counting of lighting savings

- Savings for lighting measures could be claimed in more than one program
- Approach: Request program tracking data from all residential programs with lighting measures and compare for double counting where possible

# **Best Practices**

#### R91 Impact Evaluation for HES/HES-IE

- o Cadmus, 2016
- o Review of UMP, IPMVP, California Protocols, etc.

#### o HES/HES-IE Characteristics & Evaluation Goals

- Whole house /multiple measures at a home
- Defensible estimates of savings by household and major measure group/ update PSD inputs

#### • Billing analysis is recommended approach

 Combine with other approach, such as calibrated engineering models, to improve accuracy of specific measures

# Best Practices for Billing Analysis

#### • Use billing analysis when . . .

- Savings are about 10% or more of participant consumption
- o Limited variability in the intensity, type or magnitude of treatment
- Sufficient number of homes in the model to estimate savings (more than 50)
- o Sufficient time span to allow pre- and post- data collection

#### • Features of the billing analysis should include . . .

- Savings are weather normalized
- o Fixed effects model is used
- Dummy (binary) variables are used to define the measures
